

## Renergen's Environmental Policy

Renergen operates in diverse environments and its vision is to minimise harm to the environment by ensuring that each operation is designed, operated and closed in an environmental responsible manner.

Renergen shall apply the mitigation hierarchy of avoiding, minimizing, mitigating and where necessary offsetting environmental impacts arising from its activities, products and services. This includes undertaking all necessary steps to learn from environmental impacts, incidents, audit findings and other non-compliances to prevent their recurrence in both current and future operations. Renergen will comply with all national environmental laws and where possible, international best practices and environmental standards.

To ensure this Renergen has implemented an ISO: 140000 system to proactively manage environment aspects and impacts related to the activities and services undertaken by the company in the environments in which we operate. This includes the identification and establishment of viable controls to eliminate, reduce or mitigate environmental risk. These non-negotiable environmental management and performance standards shall be applied throughout the operations as a minimum requirement.

Renergen will also ensure the appropriate allocation of resources, provision of training, education, consultation and auditing to ensure environmental compliance and where possible, best practice.
